Based on the previous studies, this study aims to evaluate the applicability of solar PV systems in the capital city (Baghdad) of Iraq and to compare the performance of PV systems with different PV ...

power of single solar panel is 205W. The optimum tilt angle of the current system is 30° and zero azimuth angle. Inverter of SMA Sunny Tripower, 15000TL-10 type was used. Maximum efficiency of ...

The current PV system is situated at Al-Taji town in Baghdad. These improvements are achieved by using planar concentrators to increase solar radiation (made of aluminium metal).

Additionally, research is being conducted on innovative approaches such as solar-powered cooling systems and direct current (DC) power distribution within data centers to further ...

Meteonorm 8.0 data are utilised in the simulation, which is run in PVsyst 7.2 and HelioScope software. Maximum energy production is the goal of the simulation, which is implemented at a constant tilt ...

Genetic Algorithm is employed successfully in this work to find the optimal site and size of PV units in a practical 11kV feeder within Baghdad distribution network. Accommodating photovoltaic units in the ...

In this work, the steady-state impacts on voltage level, voltage profile line loading and voltage stability on the distribution grids were studied.

It's created a set of data about annual electricity consumption in daily detail, and electricity consumption is simulated in a photovoltaic way. The state of compensation by photovoltaic electric generation ...
