Do Island power systems have centrally managed storage facilities?

Centrally managed storage facilities in island power systems dominate the relevant literature. Table 4 includes the papers dealing with the centrally managed storage concept. Table S2 of the Supplementary data and Fig. 7 present additional details for the most representative ones.

How important are energy storage stations in Nii?

Undoubtedly, energy storage stations (ESS) are vital for the electricity sector of NII to move to penetrations of renewables over 50 %. As can be inferred from Table 1, pumped hydro storage (PHS) and battery energy storage (BES) technologies dominate the landscape of actual grid-scale applications for island systems.

Does storage contribute to resource adequacy in Islands?

Significant research has also been conducted on the dynamic behavior of island systems in the presence of storage and the feasibility of storage investments. On the other hand, the contribution of storage to resource adequacy in islands has received limited investigation, presenting opportunities for further research in this area.

Which storage typologies are suitable for deployment in island systems?

The review process identified three main storage typologies suitable for deployment in island systems: (a) storage coupled with RES within a hybrid power station, (b) centrally managed standalone storage installations, and (c) behind-the-meter storage installations. Of particular interest are the former two, which dominate the relevant literature.
