---

Solar cycle, period of about 11 years in which fluctuations in the number and size of sunspots and solar prominences are repeated. Solar cycle 25 began in 2019 and will reach ...

Each month the solar prediction is updated using historical and the latest month's observed solar indices to provide estimates for the balance of the current solar cycle and the next.

It is possible to see the whole of Solar Cycles 23 and 24, and the first half of Cycle 25. For each cycle, the band of faster rotation starts well before the magnetic activity for that cycle.

Use the buttons above each plot to return to the default zoom showing the current cycle or to show the entire available data set. There is also an option to toggle the solar cycle numbering on/off.

The following table gives the number of days so far in cycle 25 against the number up to the same point in cycle 24, which have passed various thresholds for the numbers of sunspots.

The beginning of a solar cycle is a solar minimum, or when the Sun has the least sunspots. Over time, solar activity--and the number of sunspots--increases. The middle of the solar ...

Here's what causes the sun's 11-year cycle of activity and what it means for us on Earth.

A solar cycle system refers to the natural fluctuation in solar energy output driven by the solar cycle, which is an approximately 11-year cycle of solar activity marked by variations in the ...

Because the solar cycle reflects magnetic activity, various magnetically driven solar phenomena follow the solar cycle, including sunspots, faculae/plage, network, and coronal mass ejections.

Solar cycle, period of about 11 years in which fluctuations in the ...
