Do solar-powered unmanned aerial vehicles need an energy management system?

Abstract: An energy management system (EMS) is necessary to provide the UAV propulsion system with the energy from multiple power sources. This paper presents a new control strategy of EMS for a small solar-powered unmanned aerial vehicle (UAV).

What are the benefits of solar-powered unmanned aerial vehicles?

Additionally, it ensures that solar-powered UAVs make sufficient use of solar energy to complete high-altitude and long-duration flights in any flight task, reduce the energy consumption of the battery, and improve the flight performance of solar-powered UAVs. 2. Energy system model for solar-powered unmanned aerial vehicle

What is the energy management system of a solar-powered UAV?

The energy-consuming system comprises a thrust system and airborne equipment; the thrust system comprises a motor, propeller, reducer, and direct current/alternating current (DC/AC) converter, . Herein, an energy management system was used to control the energy distribution of a solar-powered UAV. Fig. 1.

Can EMS control a small Solar-powered unmanned aerial vehicle (UAV)?

This paper presents a new control strategy of EMS for a small solar-powered unmanned aerial vehicle (UAV). The EMS based on the value of DC bus voltage can efficiently manage the power from PV modules and the storage system, which support the UAV operation steadily even under potential rapidly varying atmospheric condition.

Discover techniques for optimizing UAV communication power consumption, enhancing flight time and operational efficiency for unmanned aerial vehicles.

Abstract--In this paper, we investigate the resource allocation design for multicarrier (MC) systems employing a solar powered unmanned aerial vehicle (UAV) for providing communication services to ...

Based on an analysis of the optimization trends, this study proposes an energy-management strategy to fulfill

What are the energy management systems for unmanned solar-powered communication cabinets

the demand for long-endurance flights.

In this paper, we consider a general UAV-enabled wireless communication system where a solar-powered UAV is deployed to provide continuous communication service

The flight path optimization and energy management method of solar-powered UAVs proposed in this study, based on a genetic algorithm and detailed energy part model, can be used to ...

Solar-powered UAVs are fixed-wing aircraft with a high aspect ratio that rely solely on solar energy for propulsion. The distinctive feature of solar-powered UAVs lies in their energy ...

An energy management system (EMS) is necessary to provide the UAV propulsion system with the energy from multiple power sources. This paper presents a new contr.

features of UAV communication compared to terrestrial wireless networks. Nevertheless, the implementation of this system is constrained by several severe challenges, such as energy ...

Solar-powered unmanned aerial vehicles (UAVs) are emerging as long-endurance platforms for sensing, communications, and environmental monitoring with low operational ...

Two types of three-dimensional (3-D) flight-based energy management strategies for solar-powered unmanned aerial vehicle (SUAV) long-endurance target tracking are proposed and ...
